CSC 201 — Data Structures

Traversal visits every node of a tree exactly once.

A linked list stores elements in nodes connected by pointers.

Binary search runs in logarithmic time on a sorted array.

Hash tables map keys to buckets using a hash function.

Insertion at the head of a singly linked list runs in constant time.

Recursion solves a problem by calling a smaller version of itself.

Queues process elements in first come, first served order.

A binary tree has at most two children per node.

A stack overflow occurs when the call stack exceeds its limit.
