BIO 150 — General Biology

Cell Structure and Function

Photosynthesis converts light energy into chemical energy.

Punnett squares predict the outcome of simple genetic crosses.

Enzymes lower the activation energy of biochemical reactions.

The cell is the basic structural unit of living organisms.

Deoxyribonucleic acid carries hereditary information from parents to offspring.

Osmosis is the movement of water across a semi permeable membrane.

Respiration releases energy from glucose in living cells.

Ecosystems consist of communities of organisms and their physical environment.
