MTH 101 — Elementary Mathematics I

Tutorial 2 — Quadratic Equations

Sets can be combined using union and intersection operations.

The sum of the interior angles of a triangle is 180 degrees.

Simultaneous equations can be solved by substitution or by elimination.

Indices follow the laws of exponents under multiplication and division.

The discriminant determines the nature of the roots of a quadratic equation.

Surds are irrational roots written in simplified form.

A quadratic equation can be written in the standard form ax squared plus bx plus c equals zero.

A straight line in the plane has the equation y equals mx plus c.

The binomial expansion gives the coefficients of powers of a sum.

The gradient of a curve at a point is found by differentiation.

Logarithms convert multiplication into addition.

Partial fractions split a rational expression into simpler terms.
