BIO 150 — General Biology

Mitosis produces two genetically identical daughter cells.

The plasma membrane controls the movement of substances into the cell.

Proteins are synthesised from amino acids at the ribosome.

Ecosystems consist of communities of organisms and their physical environment.

Photosynthesis converts light energy into chemical energy.

Punnett squares predict the outcome of simple genetic crosses.

Bacteria are prokaryotes without a membrane bound nucleus.

Deoxyribonucleic acid carries hereditary information from parents to offspring.

Enzymes lower the activation energy of biochemical reactions.

Respiration releases energy from glucose in living cells.

The cell is the basic structural unit of living organisms.

Osmosis is the movement of water across a semi permeable membrane.
