PHY 105 — General Physics

Newton's Laws of Motion

Friction opposes relative motion between two surfaces in contact.

Momentum is conserved in an isolated system.

Energy can be transformed from one form to another but not created or destroyed.

The acceleration due to gravity is about 9.8 metres per second squared.

A vector quantity has both magnitude and direction.

Ohm's law relates voltage, current, and resistance in a conductor.

Refraction bends light when it passes from one medium into another.

Newton's first law states that a body remains at rest or in uniform motion.

Work is done when a force moves an object along its direction.

Force equals mass times acceleration for a body of constant mass.

The period of a simple pendulum depends on its length.

Pressure in a fluid increases with depth.
