PHY 105 — General Physics

Lecture 3 — Newton's Laws

A vector quantity has both magnitude and direction.

Work is done when a force moves an object along its direction.

Momentum is conserved in an isolated system.

Pressure in a fluid increases with depth.

Refraction bends light when it passes from one medium into another.

Newton's first law states that a body remains at rest or in uniform motion.

Force equals mass times acceleration for a body of constant mass.

The acceleration due to gravity is about 9.8 metres per second squared.

Ohm's law relates voltage, current, and resistance in a conductor.

The period of a simple pendulum depends on its length.
